# Current Estimates

## From the Health Interview Survey United States - July 1963 - June 1964

Provisional estimates of incidence of acute conditions, number of persons reporting one or more chronic conditions, number of persons injured, hospital discharges, disability days, number of physician and dental visits, and time intervals since last physician and dental visits. Based on data collected in household interviews during the period July 1963-June 1964.

## COOPERATION OF THE BUREAU OF THE CENSUS

Under the legislation establishing the National Health Survey, the Public Health Service is authorized to use, insofar as possible, the services or facilities of other Federal, State, or private agencies.

In accordance with specifications established by the National Health Survey, the Bureau of the Census, under a contractual arrangement, participates in most aspects of survey planning, selects the sample, collects the data, and carries out certain parts of the statistical processing.

# CURRENT ESTIMATES

## FROM THE HEALTH INTERVIEW SURVEY

Charles S. Wilder, *Division of Health Interview Statistics*

### HIGHLIGHTS FOR THE PERIOD

#### Acute Conditions

During the 12 months ending June 1964 the American people, exclusive of the Armed Forces and inmates of institutions, experienced an estimated incidence of 387 million acute illnesses and injuries requiring either medical attention or restriction of daily activity (tables 1 and 4). This total is a reduction of about 13.4 million conditions from the total estimated on the basis of health interviews during the period July 1962-June 1963 as shown in the first report of this annual series entitled "Current Estimates." A substantial decline in new cases of illnesses reported as influenza and the common cold occurred during the year. However, a rise in incidence of injuries and common childhood diseases tended to cancel out a large part of the decline for these respiratory illnesses.

The overall incidence rate for the year July 1963-June 1964 was 208.5 cases of acute illnesses and injuries per 100 persons compared with a rate of 218.8 conditions per 100 persons during the previous year. The rate for illnesses reported as influenza (without digestive manifestations) was 29.8 per 100 persons compared with a rate of 42.3 per 100 persons for the earlier period. Figure 1 shows that the seasonal pattern in rates for all

acute conditions and for respiratory illnesses resembles the rates for the period July 1960-June 1961. The rate for common childhood diseases rose from 8.0 in 1962-63 per 100 persons to 13.3 during the current year. The rate for injuries was 29.7 per 100 persons during the year, as compared with 27.7 during the period July 1962-June 1963.

A rise in the incidence of measles and rubella, which occurred during the last half of the current year, contributed heavily to the increased incidence of common childhood diseases. The increase in incidence of injuries occurred primarily among males in the civilian, noninstitutional population.

Although the incidence rate of respiratory illnesses was substantially less than that during the previous year, the dramatic decline in rate for the common cold and "other influenza" was accompanied by an increase in rate for pneumonia, influenza with digestive manifestations, and other acute upper respiratory conditions.

Acute illness or injury caused an average of 8.1 days of restricted activity and 3.5 days in bed (tables 2, 3, 5, and 6). Acute conditions accounted for an estimated 4.4 days of time lost from school per school age child and 3.3 days of time lost from work per currently employed person (table 7). These rates are lower than those of the previous year.

## Persons With Chronic Conditions

An estimated 84 million persons in the civilian population, exclusive of those confined to institutions, reported one or more chronic diseases or impairments (table 8). This figure represents 45.2 percent of the population, or a slightly higher percentage than the 44.5 percent reported during the previous year. The percentage with one or more chronic conditions was higher for females than for males and increased with age at about the same rate for each sex.

## Persons Injured

About 53.2 million persons were injured during the year, a rate of 28.6 per 100 persons (table 9). This estimated rate of persons injured was appreciably higher than the rate of 26.5 per 100 persons for the previous year. The rate of injury in moving motor vehicle accidents was the same as that during the previous period. However, injuries at work, in the home, and in "other" events increased during the current year.

During the period July 1963-June 1964, 64.9 percent of the 3.8 million persons injured in moving motor vehicle accidents restricted their activities for at least 1 day. Included with these activity-restricting injuries were 37.8 percent of the 3.8 million who had to spend at least 1 day in bed. Among the other classes of accidents, the percentages of activity-restricting and bed-disabling injuries were as follows:

	<i>Activity- restricting</i>	<i>Bed- disabling</i>
While at work -----	53.4	19.3
Home -----	49.0	15.6
Other -----	58.6	24.7

Disability days associated with injury rose for all classes of accidents with the exception of the rate of bed-days for home accidents (tables 10 and 11). Disability days associated with persons injured include the days for current injuries on a person basis. They also include the days during the 2-week period resulting from residuals of old injuries classified as impairments due to injury.

## Hospital Discharges

Exclusive of those involving less than 1 night hospital stay, an estimated 23.8 million discharges from short-stay hospitals, or 12.8 discharges per 100 persons, occurred during the reference periods ending between July 1963 and June 1964 (table 12). The term, reference periods, is used because health interviews were conducted on a new sample of households during each week of the period. Information was obtained, for persons who were alive at the time of interview, on hospitalization experience during the 12-month period prior to the interview. To adjust for underreporting due to memory bias, estimates were based on hospital discharges during the recent 6 months prior to interview. For further description of hospital discharge data, see appendix II.

Among males the rate of hospital discharges increased as age rose. Among females the rate of hospital discharges was highest during childbearing years, 17-44; the rate declined at these ages but again increased among women 65 years and older.

## Disability Days

Persons in the U.S. population experienced an average of 16.2 days of restricted activity during the year July 1963-June 1964, the same rate as that for the previous year (table 13). Rates of bed-days and time lost from work and school declined during the current year. A decline in acute illnesses undoubtedly caused reduction in rate.

## Physician Visits

During the period from July 1963-June 1964, the average individual in the civilian, noninstitutional population made an estimated 14.5 physician visits (table 14). A physician visit is defined as a consultation with a physician, either in person or by telephone, for examination, diagnosis, treatment, or advice. The service could be provided by the physician himself, or

a nurse or another person acting under the physician's supervision. "Physicians" are defined as doctors of medicine and osteopathic physicians. The number of visits excludes visits to persons while they were inpatients of a hospital.

The rate of physician visits for the current year was slightly less than the estimate of 4.7 visits per person based on data collected during the July 1958-June 1959 period, and also lower than the rate of 5.3 visits reported during the year of the first Asian influenza epidemic, July 1957-June 1958. The lower rate of physician visits for the current year was probably correlated with the lower incidence rates of acute illnesses. *Health Statistics*, Series B, Number 19, presents estimates of physician visits during July 1957-June 1959.

An estimated 50.3 percent of the population had seen a physician within 6 months of the time of interview (table 15). It is significant that only 1.3 percent of the population had never made a physician visit.

### Dental Visits

An estimated 1.6 visits per person per year were made to a dentist during the current year (table 16). This rate is about the same as the 1.5 visits reported during July 1957-June 1959, as shown in *Health Statistics*, Series B, Number 15. A visit to a dentist's office for treatment or advice is considered a dental visit, even if the service is not provided directly by a dentist himself, but by a hygienist working under a dentist's supervision.

Forty-two percent of the population had made at least one dental visit during the year prior to the date of the health interview (table 17). This percentage represents an increase of 5.4 percentage points over the comparable percentage reported for the period July 1957-June 1958 (see *Health Statistics*, Series B, Number 14). Even though only 42.0 percent of the population had visited a dentist during the year prior to interview, among persons 15-24 years of age the proportion seeing the dentist during the year reached an estimated 55.2 percent.

## SOURCE AND LIMITATIONS OF DATA

The information contained in this publication is derived from household interviews conducted by the Health Interview Survey in cooperation with the U.S. Bureau of the Census in a probability sample of the civilian, noninstitutional population of the United States. The sample is designed so that interviews are conducted during every week of the year. During the 52-week period from July 1963 through June 1964, the sample was composed of approximately 42,000 households containing about 134,000 persons living at the time of the interview.

A description of the design of the Survey, the methods used in estimation, and general qualifications of the data obtained from surveys is presented in Appendix I. Since the estimates shown in this report are based on a sample of the population rather than on the entire population, they are subject to sampling error. Therefore, particular attention should be paid to the section entitled "Reliability of Estimates." Sampling errors for most of the estimates are of relatively low magnitude. However, where an estimated number or the numerator or the denominator of a rate or percentage is small, the sampling error may be high. Charts of relative sampling errors and instructions for their use are shown in Appendix I.

Certain terms used in this report are defined in Appendix II. Some of the terms have specialized meanings for the purpose of the Survey. For example, estimates of the incidence of acute conditions include, with certain exceptions, those conditions which had started within 2 weeks and which involved either medical attention or restricted activity. The exceptions, which are listed in Appendix II, are certain conditions such as heart trouble and diabetes which are always considered to be chronic, regardless of duration or onset.

Estimates of the number of disability days associated with acute conditions are derived from the number of days of disability experienced

during the 2-week period prior to the week of interview and include all such days reported, even if the acute condition causing the disability had its onset prior to the 2-week period. Disability days associated with acute conditions are recorded on a condition basis. If an individual has more than one acute condition on the same day, the count of disability days will exceed the actual number of days disabled, i.e., person days of disability.

The questionnaire used during the 12 months of data collection is illustrated in Appendix III. Information about acute conditions, persons with one or more chronic conditions, persons injured, and disability days was derived from the responses to the illness-recall questions (ques-

tions 8-14) and Table I. Information about hospital discharges was obtained from tab

Annual estimates shown were obtained by consolidating data tabulated on a quarterly basis and, due to rounding of numbers, may, in some instances, differ slightly from those prepared from annual tabulations to be released at a later date. In order to release provisional data quickly it has been necessary to limit the amount of demographic information.

An additional feature of this report is the presentation of quarterly trend data on hospital measurements subject to seasonal variation. Trend information is shown for three topics—acute conditions, persons injured, and person-disability days (tables 19, 20, and 21; figs. 1, 2, and

## APPENDIX I

### TECHNICAL NOTES ON METHODS

#### Background of This Report

This report is one of a series of statistical reports prepared by the National Health Survey. It is based on information collected in a continuing nationwide sample of households in the Health Interview Survey, a major part of the program.

The Health Interview Survey utilizes a questionnaire which, in addition to personal and demographic characteristics, obtains information on illnesses, injuries, chronic conditions and impairments, and other health topics. As data relating to each of these various broad topics are tabulated and analyzed, separate reports are issued which cover one or more of the specific topics. The present report is based on the consolidated sample for 52 weeks of interviewing ending June 1964.

The population covered by the sample for the Health Interview Survey is the civilian, noninstitutional population of the United States living at the time of the interview. The sample does not include members of the Armed Forces, U.S. nationals living in foreign countries, or crews of vessels. It should also be noted that the estimates shown do not represent a complete inventory of injuries for the specified calendar period since no adjustment has been made for persons who incurred injuries during the 2-week-recall period but who died prior to the interview.

#### Statistical Design of the Health Interview Survey

General plan.—The sampling plan of the survey follows a multistage probability design which permits a continuous sampling of the civilian population of the United States. The first stage of this design consists of drawing a sample of 357 from the 1900 geographically defined primary sampling units (PSU's) into which the United States has been divided. A PSU is a county, a group of contiguous counties, or a standard metropolitan statistical area.

With no loss in general understanding, the remaining stages can be combined and treated in this discussion as an ultimate stage. Within PSU's, then, ultimate stage units called segments are defined in such a manner that each segment contains an expected nine house-

holds. A segment consists of a cluster of neighbor households or addresses. Two general types of segments are used: (1) area segments which are defined geographically, and (2) B segments which are defined from a list of addresses from the Decennial Census and Survey of Construction. Each week a random sample of about 90 segments is drawn. In the approximately 800 households in those segments, household members are interviewed concerning factors related to health.

Since the household members interviewed each week are a representative sample of the population, samples for successive weeks can be combined into larger samples. Thus the design permits both continuous measurement of characteristics of high incidence or prevalence in the population and, through the larger consolidated samples, more detailed analysis of less common characteristics and smaller categories. The continuous collection has administrative and operational advantages as well as technical assets, since it permits field work to be handled with an experienced, stable staff.

Sample size and geographic detail.—The national sample plan for the 12-month period ending in June 1964 included about 134,000 persons from 42,000 households in about 4,700 segments.

The overall sample was designed in such a fashion that tabulations can be provided for each of the major geographic regions and for urban and rural sectors of the United States.

Collection of data.—Field operations for the household survey are performed by the Bureau of the Census under specifications established by the National Center for Health Statistics. In accordance with these specifications the Bureau of the Census selects the sample, conducts the field interviewing as an agent of the Center, and performs a manual editing and coding of questionnaires. The Health Survey, using Center electronic computers, carries out further editing and tabulates the edited data.

Estimating methods.—Each statistic produced by the survey—for example, the number of bed-disability days occurring in a specified period—is the result of two stages of ratio estimation. In the first of these, the control factor is the ratio of the 1960 decennial population count to the 1960 estimated population in the National Health Survey's first-stage sample of PSU's.

These factors are applied for some 25 color-residence classes.

Later, ratios of sample-produced estimates of the population to official Bureau of the Census figures for current population in about 60 age-sex-color classes are computed and serve as second-stage factors for ratio estimating.

The effect of the ratio-estimating process is to make the sample more closely representative of the population by age, sex, color, and residence, thus reducing sampling variance.

As noted, each week's sample represents the population living during that week and characteristics of this population. Consolidation of samples over a time period, say a calendar quarter, produces estimates of average characteristics of the U.S. population for that calendar quarter. Similarly, population data for a year are averages of the four quarterly figures.

For statistics measuring the number of occurrences during a specified time period, such as the incidence of acute conditions, a similar computational procedure is used, but the statistics are interpreted differently. For these items, the questionnaire asks for the respondent's experience over the 2 calendar weeks prior to the week of interview. In such instances the estimated quarterly total for the statistic is simply 6.5 times the average 2-week estimate produced by the 13 successive samples taken during the period. The annual total is the sum of the four quarters. Thus, the experience of persons interviewed during a year—experience which actually occurred for each person in a 2-calendar-week interval prior to week of interview—is treated as though it measured the total of such experience during the year. Such interpretation leads to no significant bias.

### General Qualifications

Nonresponse.—Data were adjusted for nonresponse by a procedure which imputes to persons in a household which was not interviewed the characteristics of persons in households in the same segment which were interviewed. The total noninterview rate was 5 percent; 1 percent was refusal, and the remainder was primarily due to the failure to find any eligible household respondent after repeated trials.

The interview process.—The statistics presented in this report are based on replies secured in interviews of persons in the sampled households. Each person 19 years of age and over, available at the time of interview, was interviewed individually. Proxy respondents within the household were employed for children and for adults not available at the time of the interview, provided the respondent was closely related to the person about whom information was being obtained.

There are limitations to the accuracy of diagnostic and other information collected in household interviews. For diagnostic information, the household respondent

can, at best, pass on to the interviewer only the information the physician has given the family. For conditions not medically attended, diagnostic information is often no more than a description of symptoms. However, other facts, such as the number of disability days caused by the condition, can be obtained more accurately from household members than from any other source since only the persons concerned are in a position to report this information.

Rounding of numbers.—The original tabulations on which the data in this report are based show all estimates to the nearest whole unit. All consolidations were made from the original tabulations using the estimates to the nearest unit. In the final published tables the figures are rounded to the nearest thousand, although these are not necessarily accurate to that detail. Devised statistics, such as rates and percent distributions, are computed after the estimates on which these are based have been rounded to the nearest thousand.

Population figures.—Some of the published tables include population figures for specified categories. Except for certain overall totals by age and sex, which are adjusted to independent estimates, these figures are based on the sample of households in the National Health Survey. These are given primarily to provide denominators for rate computation and for this purpose are more appropriate for use with the accompanying measures of health characteristics than other population data that may be available. In some instances these will permit users to recombine published data into classes more suitable to their specific needs. With the exception of the overall totals by age and sex, mentioned above, the population figures differ from corresponding figures (which are derived from different sources) published in reports of the Bureau of the Census. For population data for general use, see the official estimates presented in Bureau of the Census reports in the P-20, P-25, and P-60 series.

### Reliability of Estimates

Since the estimates are based on a sample, they will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and interviewing personnel and procedures. As in any survey, the results are also subject to measurement error.

The standard error is primarily a measure of sampling variability, that is, the variations that might occur by chance because only a sample of the population is surveyed. As calculated for this report, the standard error also reflects part of the variation which arises in the measurement process. It does not include estimates of any biases which might lie in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from a complete census by less than the standard error. The chances are about 95 out

of 100 that the difference would be less than twice the standard error and about 99 out of 100 that it would be less than  $2\frac{1}{2}$  times as large.

The relative standard error of an estimate is obtained by dividing the standard error of the estimate by the estimate itself and is expressed as a percentage of the estimate. Included in this Appendix are charts from which the relative standard errors can be determined for estimates shown in the report. In order to derive relative errors which would be applicable to a wide variety of health statistics and which could be prepared at a moderate cost, a number of approximations were required. As a result, the charts provide an estimate of the approximate relative standard error rather than the precise error for any specific aggregate or percentage.

Three classes of statistics for the health survey are identified for purposes of estimating variances.

Narrow range.—This class consists of (1) statistics which estimate a population attribute, e.g., the number of persons in a particular income group, and (2) statistics for which the measure for a single individual for the period of reference is usually either 0 or 1, on occasion may take on the value 2, and very rarely, 3.

Medium range.—This class consists of other statistics for which the measure for a single individual for the period of reference will rarely lie outside the range 0 to 5.

Wide range.—This class consists of statistics for which the measure for a single individual for the period of reference frequently will range from 0 to a number in excess of 5, e.g., the number of days of bed disability experienced during the year.

In addition to classifying variables according to whether they are narrow-, medium-, or wide-range, statistics in the survey are further defined as:

Type A.—Statistics on prevalence and incidence data for which the period of reference in the questionnaire is 12 months.

Type B.—Incidence-type statistics for which the period of reference in the questionnaire is 2 weeks.

Type C.—Statistics for which the reference period is 6 months.

Only the charts on sampling error applicable to data contained in this report are presented.

General rules for determining relative sampling errors.—The "guide" on page 27, together with the following rules, will enable the reader to determine approximate relative standard errors from the charts for estimates presented in this report.

Rule 1. Estimates of aggregates: Approximate relative standard errors for estimates of aggregates, such as the number of persons with a given characteristic, are obtained from appropriate curves on pages 28-31. The number of persons in the total U.S. population or in an age-sex class of the total population is adjusted to official Bureau of the Census figures and is not subject to sampling error.

Rule 2. Estimates of percentages in a percent distribution: Relative standard errors for percentages in a percent distribution of the total are obtained from appropriate curves on page 32. For values which do not fall on one of the curves presented in the chart, visual interpolation will provide a satisfactory approximation.

Rule 3. Estimates of rates where the numerator is a subclass of the denominator: (Not required for statistics presented in this report.)

Rule 4. Estimates of rates where the numerator is not a subclass of the denominator: This rule applies where a unit of the numerator often occurs more than once for a one unit in the denominator. For example, in the computation of the number of persons injured per 100 currently employed persons per year, it is possible that a person in the denominator could have sustained more than one of the injuries included in the numerator. Approximate relative standard errors for rates of this kind may be computed as follows:

- (a) Where the denominator is the total U.S. population, or includes all persons in one or more of the age-sex groups of the total population, the relative error of the rate is equivalent to the relative error of the numerator which can be obtained directly from the appropriate chart.
- (b) In other cases, obtain the relative standard error of the numerator and of the denominator from the appropriate curve. Square each of the relative errors, add the resulting values, and extract the square root of the sum. This procedure will result in an upper bound and often will overstate the error.

## Guide to Use of Relative Standard Error Charts

The code shown below identifies the appropriate curve to be used in estimating the relative standard error of the statistic described. The four components of each code describe the statistic as follows: (1)

A = aggregate, P = percentage; (2) the number of calendar quarters of data collection; (3) the type of the statistic as described on page 26; and (4) the range of the statistic as described on page 26.

Statistic	Use:		
	Rule	Code	on page
Number of:			
Persons in the U.S. population, or total number in any age-sex category-----	Not subject to sampling error		
Persons in any other population group-----	1	A4AN	29
Acute conditions:			
Per quarter-----	1	A1BN	28
Per year-----	1	A4BN	29
Persons with 1+ chronic conditions-----	1	A4AN	29
Persons injured-----	1	A4BN	29
Hospital discharges-----	1	A4CN	30
Disability days:			
Per quarter-----	1	A1BW	31
Per year-----	1	A4BW	29
Physician/dental visits:			
Per year-----	1	A4BM	29
Rates per 100 persons:			
Acute conditions:			
Per quarter-----	4(a)	A1BN	28
Per year-----	4(a)	A4BN	29
Persons injured-----	4(a)	A4BN	29
Hospital discharges-----	4(a)	A4CN	30
Disability days:			
Per quarter-----	4(a)	A1BW	31
Per year-----	4(a)	A4BW	29
Physician/dental visits:			
Per year-----	4(a)	A4BM	29
Percentage distribution of:			
Persons with 1+ chronic conditions-----	2	P4AN-M	32
Persons by interval since last physician/dental visit-----	2	P4AN-M	32

Relative standard errors for aggregates based on one quarter of data for type B data,  
narrow range

Example of use of chart: An aggregate of 6,000,000 (on scale at bottom of chart) for a Narrow range Type B statistic has a relative standard error of 19.3 percent, read from scale at left side of chart, or a standard error of 1,158,000 (19.3 percent of 6,000,000)

Relative standard errors for aggregates based on four quarters of data collection  
for data of all types and ranges

Example of use of chart: An aggregate of 2,000,000 (on scale at bottom of chart) for a Narrow range Type A statistic (code: A4AN) has a relative standard error of 3.6 percent, (read from scale at left side of chart), or a standard error of 72,000 (3.6 percent of 2,000,000). For a Wide range Type B statistic (code: A4BW), an aggregate of 6,000,000 has a relative error of 16.0 percent or a standard error of 960,000 (16 percent of 6,000,000).

Relative standard errors for aggregates based on four quarters of data collection  
type C, Narrow range, and type C, Wide range data

Example of use of chart: An aggregate of 1,000,000 (on scale at bottom of chart) for Narrow range type C statistic (code: A4CN) has a relative standard error of 7.1 per cent read from scale at left side of chart, or a standard error of 71,000 (7.1 percent 1,000,000).

Relative standard errors for aggregates based on one quarter of data collection for type B data, wide range

Example of use of chart: An aggregate of 20,000,000 (on scale at bottom of chart) for a wide range type B statistic has a relative standard error of 16.0 percent, read from scale at left side of chart, or a standard error of 3,200,000 (16.0 percent of 20,000,000).

Relative standard errors for percentages based on four quarters of data collection  
for type A data, Narrow and Medium range  
(Base of percentage shown on curves in millions)

Example of use of chart: An estimate of 20 percent (on scale at bottom of chart) based on an estimate of 10,000,000 has a relative standard error of 3.2 percent (read from the scale at the left side of the chart), the point at which the curve for a base of 10,000,000 intersects the vertical line for 20 percent. The standard error in percentage points is equal to 20 percent X 3.2 percent or 0.64 percentage points.

Relative standard errors for percentages based on four quarters of data collection  
for type B data, Narrow and Medium range

(Base of percentage shown on curves in millions)

Example of use of chart: An estimate of 20 percent (on scale at bottom of chart) based on an estimate of 10,000,000 has a relative standard error of 17.0 percent (read from scale at the left side of the chart), the point at which the curve for a base of 10,000,000 intersects the vertical line for 20 percent. The standard error in percentage points is equal to 20 percent X 17.0 percent or 3.4 percentage points.

Relative standard errors for percentages based on four quarters of data collection  
for type B data, Wide range  
(Base of percentage shown on curves in millions)

Example of use of chart: An estimate of 20 percent (on scale at bottom of chart) based on an estimate of 10,000,000 has a relative standard error of 24.5 percent (read from scale at the left side of the chart), the point at which the curve for a base of 10,000,000 intersects the vertical line for 20 percent. The standard error in percentage points is equal to 20 percent X 24.5 percent or 4.9 percentage points.

(Base of percentage shown on curves in millions)

Relative standard errors for percentages based on four quarters of data collection for type C data, Wide range

Example of use of chart: An estimate of 20 percent (on scale at bottom of chart) based on an estimate of 10,000,000 has a relative standard error of 6.3 percent (read from scale at the left side of the chart), the point at which the curve for a base of 10,000,000 intersects the vertical line for 20 percent. The standard error in percentage points is equal to 20 percent X 6.3 percent or 1.3 percentage points.

## APPENDIX II

### DEFINITIONS OF CERTAIN TERMS USED IN THIS REPORT

#### Terms Relating to Conditions

**Condition.**—A morbidity condition, or simply a condition, is any entry on the questionnaire which describes a departure from a state of physical or mental well-being. It results from a positive response to one of a series of "illness-recall" questions. In the coding and tabulating process, conditions are selected or classified according to a number of different criteria, such as whether they were medically attended; whether they resulted in disability; whether they were acute or chronic; or according to the type of disease, injury, impairment, or symptoms reported. For the purposes of each published report or set of tables, only those conditions recorded on the questionnaire which satisfy certain stated criteria are included.

Acute conditions are classified by type according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household-interview-type survey.

**Acute condition.**—An acute condition is defined as a condition which has lasted less than 3 months and which has involved either medical attention or restricted activity. Because of the procedures used to estimate incidence, the acute conditions included in this report are the conditions which had their onset during the 2 weeks prior to the interview week and which involved either medical attention or restricted activity during the 2-week period. However, it excludes certain conditions which are always classified as chronic (listed below) even though the onset occurred within 3 months prior to week of interview.

Conditions always classified as chronic:

Asthma	Stomach ulcer
Hay fever	Any other chronic stomach trouble
Tuberculosis	Kidney stones or chronic kidney trouble
Chronic bronchitis	Arthritis or rheumatism
Repeated attacks of sinus trouble	Mental illness
Rheumatic fever	Diabetes
Hardening of the arteries	Thyroid trouble or goiter
High blood pressure	Any allergy
Heart trouble	Epilepsy
Stroke	Chronic nervous trouble
Trouble with varicose veins	Cancer
Hemorrhoids or piles	Chronic skin trouble
Tumor, cyst, or growth	Hernia or rupture
Chronic gallbladder or liver trouble	Prostate trouble

Deafness or serious trouble with hearing  
 Serious trouble with seeing, even when wearing glasses  
 Cleft palate  
 Any speech defect  
 Missing fingers, hand, or arm—toes, foot, or leg  
 Palsy

Paralysis of any kind  
 Repeated trouble with back or spine  
 Club foot  
 Permanent stiffness or deformity of the foot, leg, fingers, arm, or back  
 Condition present since birth

**Condition groups.**—Conditions are classified according to the International Classification of Diseases, 1955 Revision, with certain modifications adopted to make the code more suitable for a household-interview survey. In this report, all tables which have data classified by type of condition employ a 5-category regrouping plus several selected subgroups. The International Classification code numbers included in each category are shown below:

Condition Groups	International Classification Code Numbers
I Infective and parasitic diseases	020-138
II Respiratory conditions	470-501, 511, 517-525, 527, 783
Upper respiratory	470-475, 511, 517
Other respiratory	480-501, 518-525, 527, 783
III Digestive system conditions	530-539, 543-553, 570, 571, 573-587, 784, 785
IV Injuries	N800-N885, N890-N895, N900-N994, N996-N999
V Other conditions	All other acute code numbers

#### Terms Relating to Chronic Conditions

**Condition.**—A morbidity condition, or simply a condition, is any entry on the questionnaire which describes a departure from a state of physical or mental well-being. It results from a positive response to one of a series of "illness-recall" questions. In the coding

and tabulating process, conditions are selected or classified according to a number of different criteria, such as whether they were medically attended; whether they resulted in disability; whether they were acute or chronic; or according to the type of disease, injury, impairment, or symptom reported. For the purposes of each published report or set of tables, only those conditions recorded on the questionnaire which satisfy certain stated criteria are included.

Conditions, except impairments, are coded by type according to the International Classification of Diseases with certain modifications adopted to make the code more suitable for a household-interview-type survey.

**Chronic condition.**—A condition is considered to be chronic if (1) it is described by the respondent in terms of one of the chronic diseases on the "Check List of Chronic Conditions" or in terms of one of the types of impairments on the "Check List of Impairments," or (2) the condition is described by the respondent as having been first noticed more than 3 months before the week of the interview.

**Impairments.**—Impairments are chronic or permanent defects, usually static in nature, resulting from disease, injury, or congenital malformation. They represent decrease or loss of ability to perform various functions, particularly those of the musculoskeletal system and the sense organs. All impairments are classified by means of a special supplementary code for impairments. Hence, code numbers for impairments in the International Classification of Diseases are not used. In the Supplementary Code, impairments are grouped according to type of functional impairment and etiology.

**Persons with chronic conditions.**—The estimated number of persons with chronic conditions is based on the number of persons who at the time of the interview were reported to have one or more chronic conditions.

**Prevalence of conditions.**—In general, prevalence of conditions is the estimated number of conditions of a specified type existing at a specified time or the average number existing during a specified interval of time. The prevalence of chronic conditions is defined as the number of chronic cases reported to be present or assumed to be present at the time of the interview; those assumed to be present at the time of the interview are cases described by the respondent in terms of one of the chronic diseases on the "Check List of Chronic Conditions" and reported to have been present at some time during the 12-month period prior to the interview.

**Onset of condition.**—A condition is considered to have had its onset when it was first noticed. This could be the time the person first felt sick or became injured, or it could be the time when the person or his family was first told by a physician that he had a condition of which he was previously unaware.

**Incidence of conditions.**—The incidence of conditions is the estimated number of conditions having their onset in a specified time period. As previously mentioned, minor acute conditions involving neither restricted activity nor medical attention are excluded from the statistics. The incidence data shown in some reports are further limited to various subclasses of conditions, such as "incidence of conditions involving bed disability."

**Activity-restricting condition.**—An activity restricting condition is a condition which has caused at least 1 day of restricted activity during the 2 calendar weeks before the interview week. (See definition of "Restricted-activity day.") The incidence of acute activity-restricting conditions is estimated from the number of such conditions reported as having started in the 2-week period, but a condition which did not result in restricted activity until after the end of the 2-week period in which it had its onset is included.

**Bed-disabling condition.**—A condition involving at least 1 day of bed disability is called a bed-disabling condition. (See definition of "Bed-disability day.") The incidence of acute bed-disabling conditions is defined in a manner analogous to the incidence of acute activity-restricting conditions.

**Medically attended condition.**—A condition is considered medically attended if a physician has been consulted about it either at its onset or at any time thereafter. Medical attention includes consultation either in person or by telephone for treatment or advice. Advice from the physician transmitted to the patient through the nurse is counted as well as visits to physicians in clinics or hospitals. If during the course of a single visit the physician is consulted about more than one condition for each of several patients, each condition of each patient is counted as medically attended.

Discussions of a child's condition by the physician and a responsible member of the household are considered as medical attention even if the child was not seen at that time.

For the purpose of this definition, the term "physician" includes doctors of medicine and osteopathic physicians.

## Terms Relating to Persons Injured

**Injury condition.**—An injury condition, or simply injury, is a condition of the type that is classified according to the nature of injury code numbers (N8-N999) in the International Classification of Diseases: addition to fractures, lacerations, contusions, burns, and so forth, which are commonly thought of as injuries. A group of codes include: effects of exposure, such as sunburn; adverse reactions to immunization and other medical procedures; and poisonings. Unless otherwise specified, the term injury is used to cover all of the above.

Since a person may sustain more than one injury from a single accident, e.g., a broken leg and laceration of the scalp, the number of injury conditions may exceed the number of persons injured.

Statistics of acute injury conditions include only those injuries which involved at least 1 full day of restricted activity or medical attendance.

**Person injured.**—A person injured is one who sustained one or more injuries in an accident or from some type of nonaccidental violence (see definition of "Injury condition" above). Each time a person is involved in an accident or in nonaccidental violence causing

ing injury that results in at least 1 full day of restricted activity or medical attention, he is included in the statistics as a separate "person injured"; hence, one person may be included more than once.

The number of persons injured is not equivalent to the number of "accidents" for several reasons: (1) the term "accident" as commonly used may not involve injury at all; (2) more than one injured person may be involved in a single accident so that the number of accidents resulting in injury would be less than the number of persons injured in accidents; and (3) the term "accident" ordinarily implies an accidental origin, whereas "persons injured" as used in the National Health Survey includes persons whose injury resulted from certain nonaccidental violence.

The number of persons injured in a specified time interval is always equal to or less than the incidence of injury conditions, since one person may incur more than one injury in a single accident.

### Terms Relating to Class of Accident

Class of accident.—Injuries, injured persons, and resulting days of disability may be grouped according to class of accident. This is a broad classification of the types of event which resulted in persons being injured. Most of these events are accidents in the usual sense of the word, but some are other kinds of mishap, such as overexposure to the sun or adverse reactions to medical procedures, and others are nonaccidental violence, such as attempted suicide. The classes of accidents are: (1) moving motor-vehicle accidents, (2) accidents occurring while at work, (3) home accidents, and (4) other accidents. These categories are not mutually exclusive. For example, a person may be injured in a moving motor-vehicle accident which occurred while the person was at home or at work. The accident class "motor vehicle" includes "home-motor vehicle" and "while at work-motor vehicle"; the accident class "while at work" includes "home-while at work"; therefore the class "home accidents" excludes combinations with "while at work" and "moving motor vehicle."

Motor-vehicle accident.—The class of accident is "motor vehicle" if a motor vehicle was involved in any way. Thus, it is not restricted to moving motor vehicles or to persons riding in motor vehicles. A motor vehicle is any mechanically or electrically powered device, not operated on rails, upon which or by which any person or property may be transported or drawn upon a land highway. Any object, such as a trailer, coaster, sled, or wagon, being towed by a motor vehicle is considered a part of the motor vehicle. Devices used solely for moving persons or materials within the confines of a building and its premises are not counted as motor vehicles.

Moving motor vehicle.—The accident is classified as "moving motor vehicle" if at least one of the motor vehicles involved in the accident was moving at the time of the accident.

Nonmoving motor vehicle.—The accident is classified as "nonmoving motor vehicle" if the motor vehicle was not moving at the time of the accident.

Accident while at work.—The class of accident is "while at work" if the injured person was 17 years of age or over and was at work at a job or a business at the time the accident happened.

Home accident.—The class of accident is "home" if the injury occurred either inside the house or outside the house. "Outside the house" refers to the yard, buildings, and sidewalks on the property. "Home" includes not only the person's own home but also any other home in which he might have been when he was injured.

Other.—The class of accident is "other" if the occurrence of injury cannot be classified in one or more of the first three class-of-accident categories. This category therefore includes persons injured in public places (e.g., tripping and falling in a store or on a public sidewalk), and also nonaccidental injuries such as homicidal and suicidal attempts. The survey does not cover the military population, but current disability of various types resulting from prior injury occurring while the person was in the Armed Forces is covered and is included in this class. The class also includes mishaps for which the class of accident could not be ascertained.

### Terms Relating to Disability

Disability.—Disability is the general term used to describe any temporary or long-term reduction of a person's activity as a result of an acute or chronic condition.

Disability days are classified according to whether they are days of restricted activity, bed-days, work-loss days, or school-loss days. All days of bed disability are, by definition, days of restricted activity. The converse form of this statement is, of course, not true. Days lost from work and days lost from school are also days of restricted activity for the working and school-age populations. Hence, restricted activity is the most inclusive term used in describing disability days.

Condition-days of restricted activity, bed disability, etc.—Condition-days of restricted activity, bed disability, and so forth are days of the various forms of disability associated with any one condition. Since any particular day of disability may be associated with more than one condition, the sum of days for all conditions adds to more than the total number of person-days of disability.

Restricted-activity day.—A day of restricted activity is one on which a person substantially reduces the amount of activity normal for that day because of a specific illness or injury. The type of reduction varies with the age and occupation of the individual as well as with the day of the week or season of the year. Restricted activity covers the range from substantial reduction to complete inactivity for the entire day.

Bed-disability day.—A day of bed disability is one on which a person stays in bed for all or most of the day because of a specific illness or injury. It is considered to be a day only if the period of bed disability includes more than half of the daylight hours. All hospital days for inpatients are considered to be days of bed disability even if the patient was not actually in bed at the hospital.

Work-loss day.—A day lost from work is a normal working day on which a person did not work at his job or business because of a specific illness or injury. If the person's regular work day is less than a whole day and the entire work day was lost, it would be counted as a whole work day lost. The number of days lost from work is determined only for persons 17 years of age or over who reported that at any time during the 2-week period covered by the interview they either worked at or had a job or business (See "Currently employed persons").

School-loss day.—A day lost from school is a normal school day on which a child did not attend school because of a specific illness or injury. The number of days lost from school is determined only for children 6-16 years of age.

Person-days of restricted activity, bed disability, etc.—Person-days of restricted activity, bed disability, and so forth are days of the various forms of disability experienced by any one person. The sum of days for all persons in a group represents an unduplicated count of all days of disability for the group.

#### Terms Relating to Hospitalization

Hospital discharge.—A hospital discharge is the completion of any continuous period of stay of one or more nights in a hospital, as an inpatient, except the period of stay of a well, newborn infant. A hospital discharge is recorded whenever a present member of the household is reported to have been discharged from a hospital in the 12-month period prior to the interview week. (Estimates were based on discharges which occurred during the 6-month period prior to the interview.)

Hospital.—For this survey a hospital is defined as any institution meeting one of the following criteria: (1) named in the listing of hospitals in the 1957-1959 Guide Issues of Hospitals, the Journal of the American Hospital Association; (2) named in the listing of hospitals in the 1957-1960 Directories of the American Osteopathic Hospital Association; or (3) named in the annual inventory of hospitals and related facilities submitted by the States to the Division of Hospital and Medical Facilities of the U. S. Public Health Service in conjunction with the Hill-Burton program.

Hospital ownership.—Hospital ownership is a classification of hospitals according to the type of organization that controls and operates the hospital. The category to which an individual hospital is assigned and the

definition of these categories follows the usage of the American Hospital Association.

Type of hospital service.—Type of hospital service is a classification of hospitals according to the dominant type of cases for which they provide service. The category to which an individual hospital is assigned and the definition of these categories follow the usage of the American Hospital Association.

Short-stay hospital.—A short-stay hospital is one for which the type of service is general; maternity; eye, ear, nose, and throat; children's; osteopathic hospital; or hospital department of institution.

#### Terms Relating to Physician and Dental Visits

Physician visit.—A physician visit is defined as a consultation with a physician, in person or by telephone for examination, diagnosis, treatment, or advice. A visit is considered to be a physician visit if the service is provided directly by the physician or by a nurse or other person acting under a physician's supervision. For the purpose of this definition "physician" includes doctors of medicine and osteopathic physicians. The term "doctor" is used in the interview, rather than "physician," because of the need to keep to popular usage. However, the concept toward which all instructions are directed is that which is described in the definition.

Physician visits for services provided on a mass basis are not included in the tabulations. A service received on a mass basis is defined as any service involving only a single test (e.g., test for diabetes) or a single procedure (e.g., smallpox vaccination) in which this single service was administered identically to persons who were at the place for this purpose. Persons passing through a tuberculosis chest X-ray trailer, by this definition, are not included as physician visits. However, a special chest X-ray given in a physician's office or an outpatient clinic is considered a physician visit.

Physician visits to hospital inpatients are not included.

If a physician is called to the house to see more than one person, the call is considered to be a separate physician visit for each person about whom the physician was consulted.

A physician visit is associated with the person about whom the advice was sought, even if that person did not actually see or consult the physician. For example, if a mother consults a physician about her children, the physician visit is ascribed to the child.

Interval since last physician visit.—The interval since the last physician visit is the length of time from the last physician visit to the week of interview since a physician was

consulted in person or by telephone for treatment or advice of any type whatsoever. (See definition of "Physician visit.")

Dental visit.—Each visit to a dentist's office for treatment or advice is considered a dental visit. The visit may involve services provided directly by the dentist or by a technician or a dental hygienist acting under a dentist's supervision. Services provided while a person was a patient in a hospital for overnight or longer are not considered dental visits.

Interval since last dental visit.—The interval since the last dental visit is the length of time prior to the week of interview since a dentist or dental hygienist was last visited for treatment or advice of any type whatsoever.

### Demographic Terms

Age.—The age recorded for each person is the age at last birthday. Age is recorded in single years and grouped in a variety of distributions depending upon the purpose of the table.

Currently employed persons.—Currently employed persons are all persons 17 years of age or over who reported that at any time during the 2-week period covered by the interview they either worked at, or had a job or business. Current employment includes paid work as an employee of someone else, self-employment in business, farming, or professional practice, and unpaid work in a family business or farm. Persons who were temporarily absent from their job or business

because of a temporary illness, vacation, strike, or bad weather are considered as currently employed if they expected to work as soon as the particular event causing their absence no longer existed.

Free-lance workers are considered as currently employed if they had a definite arrangement with one or more employers to work for pay according to a weekly or monthly schedule, either full time or part time. Excluded from the currently employed are such persons who have no definite arrangements but work only when their services are needed.

Also excluded from the currently employed population are (1) persons receiving revenue from an enterprise in whose operation they did not participate, (2) persons doing housework or charity work for which they received no pay, and (3) seasonal workers during the unemployment season.

The number of currently employed persons estimated by the National Health Survey (NHS) will differ from the estimates prepared by the Current Population Survey (CPS), Bureau of the Census for several reasons. In addition to sampling variability they include three primary conceptual differences, namely: (1) NHS estimates are for persons 17 years of age or over; CPS estimates are for persons 14 years of age or over. (2) NHS uses a 2-week-reference period while CPS uses a 1-week reference period. (3) NHS is a continuing survey with separate samples taken weekly, while CPS is a monthly sample taken for the survey week which includes the 12th of the month.

<p>1. (a) What is the name of the head of this household? (Enter name in first column)          (b) What are the names of all other persons who live here? (List all persons who live here)          (c) I have listed (Read names). Is there anyone else staying here now such as friends, relatives, or roomers?          (d) Have I missed anyone who usually lives here but is now _____              Temporarily in a hospital? _____              Away on business? _____              On a visit or vacation? _____</p> <p style="text-align: right;"> <input type="checkbox"/> Yes (List)    <input type="checkbox"/> No  <input type="checkbox"/> Yes (List)    <input type="checkbox"/> No  <input type="checkbox"/> Yes (List)    <input type="checkbox"/> No         </p> <p>(e) Do any of the people in this household have a home anywhere else?  <input type="checkbox"/> Yes (Apply household membership rules; if not a household member, delete)    <input type="checkbox"/> No (Leave on questionnaire)</p> <p>If any adult males listed, ask:          (f) Are any of the persons in this household now on full-time active duty with the Armed Forces of the United States?    <input type="checkbox"/> Yes (Delete)    <input type="checkbox"/> No</p>	<p>Last name ① _____</p> <p>First name _____</p>
2. How are you related to the head of the household? (Enter relationship to head, for example: wife, daughter, grandson, mother-in-law, partner, roomer, roomer's wife, etc.)	Relationship _____ Head _____
3. How old were you on your last birthday?	Age _____ <input type="checkbox"/> Under 1
4. Race (Check one box for each person)	<input type="checkbox"/> White <input type="checkbox"/> Negro <input type="checkbox"/> Other
5. Sex (Check one box for each person)	<input type="checkbox"/> Male <input type="checkbox"/> Female
If 17 years old or over, ask:	
6. Are you now married, widowed, divorced, separated or never married? (Check one box for each person)	<input type="checkbox"/> Und 17 yrs. <input type="checkbox"/> Never m <input type="checkbox"/> Married <input type="checkbox"/> Divorce <input type="checkbox"/> Widowed <input type="checkbox"/> Separate
If 17 years old or over, ask:	<input type="checkbox"/> Und. 17
7. (a) What were you doing most of the past 12 months — (For males): working, or doing something else? (For females): keeping house, working or doing something else? If "Something else" checked, and person is 45 years old or over, ask: (b) Are you retired?	<input type="checkbox"/> Working <input type="checkbox"/> Keeping house <input type="checkbox"/> Something else <input type="checkbox"/> Yes <input type="checkbox"/> No
<b>H</b> Determine which adults are at home and record this information. Beginning with Question 8 you are to interview for himself or herself, each adult person who is at home. (If person under 19 is the respondent, check the "At home" box.)	<input type="checkbox"/> At home <input type="checkbox"/> Und. 19 <input type="checkbox"/> Not at h
8. Were you sick at any time LAST WEEK OR THE WEEK BEFORE? (That is, the 2-week period which ended this past Sunday night.) (a) What was the matter? (b) Anything else?	<input type="checkbox"/> Yes ① <input type="checkbox"/>
9. Last week or the week before did you take any medicine or treatment for any condition (besides ... which you told me about)? (a) For what conditions? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/>
10. Last week or the week before did you have any accidents or injuries? (a) What were they? (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/>
11. Did you ever have an (any other) accident or injury that still bothers you or affects you in any way? (a) In what way does it bother you? (Record present effects) (b) Anything else?	<input type="checkbox"/> Yes <input type="checkbox"/>
12. Has anyone in the family - you, your -, etc. - had any of these conditions DURING THE PAST 12 MONTHS? (Read Card A, condition by condition; record in his column any conditions mentioned for the person)	<input type="checkbox"/> Yes <input type="checkbox"/>
13. Does anyone in the family have any of these conditions? (Read Card B, condition by condition; record in his column any conditions mentioned for the person)	<input type="checkbox"/> Yes <input type="checkbox"/>
14. Do you have any other ailments, conditions, or problems with your health? (a) What is the condition? (Record condition itself if still present; otherwise record present effects.) (b) Any other problems with your health?	<input type="checkbox"/> Yes <input type="checkbox"/>
15. (a) Have you been in a hospital at any time since _____, a year ago? If "Yes," ask: (b) How many times were you in the hospital during that period?	<input type="checkbox"/> Yes ① <input type="checkbox"/> _____ No. of times
16. (a) Has anyone in the family been a patient in a nursing home, rest home, or any similar place since _____, a year ago? If "Yes," ask: (b) Who was this? (c) How many times were you in a nursing home or rest home during that period?	<input type="checkbox"/> Yes <input type="checkbox"/> _____ No. of time:
<b>R</b> (For Q. 8-16) For persons 19 years old or over, show who responded for (or was present during the asking of) Q. 8-16. If persons responded for self, show whether entirely or partly. For persons under 19 show who responded for them.	<input type="checkbox"/> Responded for self-entirely <input type="checkbox"/> Responded for self-partly Col. _____ was respondent
INTERVIEWER: Examine ages and relationships in Questions 2 and 3 for children one year old or under, then check the appropriate box in Question 17(a).	
17. (a) <input type="checkbox"/> Baby (babies) one year or under listed. (Go to Q. 17b) <input type="checkbox"/> No baby (babies) one year or under listed. (Go to Q. 18)	(b) Are birth(s) for baby (babies) and delivery for mother shown in Table II? <input type="checkbox"/> Yes (Go to Q. 18) <input type="checkbox"/> No (Go to Q. 17(c))
(c) Was --- born in the hospital? <input type="checkbox"/> Yes (Go to Q. 17(d)) <input type="checkbox"/> No (Go to Q. 18)	(d) When was --- born? (Enter month, day and year. Month _____ Day _____ Year _____ (If birthdate is on or after date shown in Qs. 15 and 16, fill one line of Table II for mother at one line for child.)
INTERVIEWER: After completing Table II for all persons, carry each condition in Col. (h) or Col. (i) back to Table I if it does not already appear there and either { "1" or more nights in Column (f) OR an Impairment OR a Condition on Card A.	

<b>18. LAST WEEK OR THE WEEK BEFORE</b> did anyone in the family go to a dentist?  If "Yes," ask: (a) Who was this? (b) Anyone else? For each person with "Yes" checked, ask: (c) How many times did you visit the dentist <b>LAST WEEK OR THE WEEK BEFORE</b> ? (d) What did you have done (the last time, the time before, etc.)? (e) Anything else?		<input type="checkbox"/> Yes <input type="checkbox"/> No No. of times (1) (2) (3) <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Fillings <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Extractions or other surgery <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Straightening (Orthodontia) <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Treatment for gums <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Cleaning teeth <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Examination <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Denture work <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> Other (Specify)																								
If "No" to Question 18, ask: <b>19. ABOUT</b> how long has it been since you went to a dentist?		<input type="checkbox"/> Under 6 mos. <input type="checkbox"/> 6-12 mos. No. of years _____ <input type="checkbox"/> Never																								
<b>20. LAST WEEK OR THE WEEK BEFORE</b> did anyone in the family talk to a doctor or go to a doctor's office or clinic? If "Yes," ask: (a) Who was this? (b) Anyone else? For EACH person with "Yes" box checked, ask Questions 20(c) through (f): (c) How many times did you see or talk to a doctor <b>LAST WEEK</b> ? (d) How many times did you see or talk to a doctor the <b>WEEK BEFORE LAST</b> ? Ask for EACH visit to a doctor in last 2 weeks: (e) Where did you talk to the doctor (the last time, the time before, etc.)? (f) Why did you go to (call) the doctor (that time)?	<div style="border: 1px solid black; padding: 5px; margin-bottom: 5px;"> <b>INTERVIEWER: DO NOT COUNT</b> doctors seen while an inpatient in a hospital         </div> <table border="1" style="width: 100%; border-collapse: collapse; font-size: small;"> <thead> <tr> <th style="width: 30%;">Place</th> <th style="width: 70%;">Purpose</th> </tr> </thead> <tbody> <tr> <td>Home = At home</td> <td>D/T = Diag. or treatment</td> </tr> <tr> <td>Off. = At office</td> <td>Not. = Pre/post natal care</td> </tr> <tr> <td>Clin. = Outpatient Hospital Clinic</td> <td>Gen. = Gen'l check-up</td> </tr> <tr> <td>Co. = Company or industry</td> <td>I/V = Immun./Vacc. # REPORTS FROM THE NATIONAL CENTER FOR HEALTH STATISTICS

Public Health Service Publication No. 1000

## Series 1. Programs and collection procedures

- No. 1. Origin, Program, and Operation of the U.S. National Health Survey. 35 cents.
- No. 2. Health Survey Procedure: Concepts, Questionnaire Development, and Definitions in the Health Examination Survey. 45 cents.

## Series 2. Data evaluation and methods research

- No. 1. Comparison of Two Vision-Testing Devices. 30 cents.
- No. 2. Measurement of Personal Health Expenditures. 45 cents.
- No. 3. The One-Hour Oral Glucose Tolerance Test. 30 cents.
- No. 4. Comparisons of Two Methods of Constructing Abridged Life Tables. 15 cents.

## Series 3. Analytical studies

- No. 1. The Change in Mortality Trend in the United States. 35 cents.
- No. 2. Recent Mortality Trends in Chile. 30 cents.

## Series 4. Documents and committee reports

No reports to date.

## Series 10. Data From the Health Interview Survey

- No. 1. Acute Conditions, Incidence and Associated Disability, United States, July 1961-June 1962. 40 cents.
- No. 2. Family Income in Relation to Selected Health Characteristics, United States. 40 cents.
- No. 3. Length of Convalescence After Surgery, United States, July 1960-June 1961. 35 cents.
- No. 4. Disability Days, United States, July 1961-June 1962. 40 cents.
- No. 5. Current Estimates From the Health Interview Survey, United States, July 1962-June 1963. 35 cents.
- No. 6. Impairments Due to Injury, by Class and Type of Accident, United States, July 1959-June 1961. 25 cents.
- No. 7. Disability Among Persons in the Labor Force, by Employment Status, United States, July 1961-June 1962. 40 cents.
- No. 8. Types of Injuries, Incidence and Associated Disability, United States, July 1957-June 1961. 35 cents.
- No. 9. Medical Care, Health Status, and Family Income, United States. 55 cents.
- No. 10. Acute Conditions, Incidence and Associated Disability, United States, July 1962-June 1963. 45 cents.
- No. 11. Health Insurance Coverage, United States, July 1962-June 1963. 35 cents.
- No. 12. Bed Disability Among the Chronically Limited, United States, June 1957-July 1961.
- No. 13. Current Estimates From the Health Interview Survey, United States, July 1963-June 1964.

## Series 11. Data From the Health Examination Survey

- No. 1. Cycle I of the Health Examination Survey: Sample and Response, United States, 1960-1962. 30 cents.
- No. 2. Glucose Tolerance of Adults, United States, 1960-1962. 25 cents.
- No. 3. Binocular Visual Acuity of Adults, United States, 1960-1962. 25 cents.
- No. 4. Blood Pressure of Adults, by Age and Sex, United States, 1960-1962. 35 cents.
- No. 5. Blood Pressure of Adults, by Race and Area, United States, 1960-1962. 25 cents.
- No. 6. Heart Disease in Adults, United States, 1960-1962.
